## With an Eye on Exams

*By Dr Tom Myslik*

I have been in practice since 1978 and am proud to be associated with Stack Optical for their skills, professionalism and integrity. I can assure you that Allen and Damian will complete your eyewear experience with same care that I give your eyes.

Keep in mind that Eye Exams are not just for eyeglass or contact lens prescriptions, general health and condition of your eyes is also evaluated. If you wear contacts, be sure to come in yearly. If you wear eyewear, 1-2 years is fine depending on age and past issues if any. If any questions ever arise be sure to call our staff.

## Advancing Technology

*By Allen Stack*

For some of you it may have been a while since you were in, so I thought I share with you some of the latest in eyewear technology. The last couple of months we introduced a new lens technology called **Freeform**, lenses that are made with the precision of lasers and diamonds to produce an accuracy that was previously unattainable. For those of you who had tried progressive addition lenses and had problems adapting, or have wanted a lens with more useable viewing area, we have a lens for you. We also have new materials that can make your lenses thinner and lighter like never before. Some other advancements have been our super light frames that almost disappear on your face. Anti-reflective coatings have been going through advancements as well. This allows us to see better by allowing more light to enter the eye. Since we manufacture our own eye wear, they are done in days and not weeks. Hope to see you soon

## Spring and Sunwear

*By Damian Linenberger*

There is a new Sun Lens now available called "Drivewear". Drivewear Polarized Transition Lenses provide safe and comfortable vision by adjusting to varying light conditions. In low light or overcast conditions, the lenses are a high contrast green/yellow color. Behind the windshield in normal daylight conditions, the lens turns to a copper color to remove excess light and provide better traffic signal recognition. In bright light outside, the lens darkens to reddish brown color designed for maximum filtration of excess light. I've been wearing these lenses for several years and enjoy them immensely. I especially like the fact that no matter the lighting conditions, there is no strain on my eyes. In fact, on my way home from my favorite fishing hole, I don't have to change my glasses when I stop at the grocery store to mosey around the "Fish Department".

## Understanding Disabilities

*By Marilyn Stack (owner's wife)*

As some of you may or may not know, Allen is a below the knee amputee. This past February, he was invited up to Winter Park to help celebrate the National Sports Center for the Disabled (NSCD) 40<sup>th</sup> anniversary. He was one of 23 kids that were taught how to ski in 1970.

This program has helped thousands of children of various disabilities to have a better quality of life. This program shows them that if they can do this, they can do anything despite their disability. I am so impressed with what this program has done for so many.

The reason that I wanted to let you know about this is because Allen understands that people with disabilities may need special eyewear. From folks that are missing ears, to a drooping eyelid or a disabled arm or any physical problem that make eyewear a challenge. He will listen and be able to come up with a solution. So if you or someone you know needs help in this area, please give him a call.
